

Setting up your Digital Workspace? Consider this

The first thing you need to know is, that there is no single product or service that fulfills all document sharing and collaboration requirements. Rather, you need to consider a number of factors before deciding what is right for your organization. Here are the main factors you should consider:

Universal Access

Does the solution allow you to share documents from all the devices you work with, like desktop computers, smartphones, tablets, and web interfaces?

The well-known file sync products like Dropbox and Google Drive provide universal access via an extremely simple user interface. Enterprise Content Management (ECM) products like Microsoft SharePoint, EMC Documentum, OpenText etc lack this convenience. While 'accessible' on all platforms, it is only via a complex web interface, that business users find hard to use. Good native interfaces are sorely lacking.

Security concerns

Does the solution provide password protection, encryption, and document access control, containerization, tracking and reporting and centralized provisioning for setting up document storage and access rights?

'Free' Cloud services like Dropbox and Google Drive typically do not. So these services need to be augmented with a variety of overlays to make them secure. However, asking IT to configure and manage these overlays is what end users dislike. They want simple, 'hands-off' document storage and sharing. Because once you get IT involved, these solutions lose their luster. Enterprise Content Management (ECM) of course provides much of this out of the box, specifically for the desktop and web.

Going Public or Stay Private

Does the Solution store documents in a public cloud, private cloud, or on corporate servers under the control of central IT?

This is a complex issue that depends a lot on legal requirements, the particular industry, corporate culture and plain downright pragmatism. Products like Dropbox and Google Drive are strictly cloud-based, while AIRworkspace offers the flexibility to be either; Off-Premise or On-Premises, including mixed 'hybrid' models. For many organizations, a hybrid model that provides important flexibility and future proofing should at least be explored.

OPEN TEXT documentum

The Universal Information Management Platform, the solution you can use for your Digital Workspace.

AIRWORKSPACE

OneDrive

Google docs

SugarSync

The Enterprise Content Management (ECM) and File Sync landscape, Universal Information Management (UIM) is located between ECM and File Sync, integrate the best of both worlds.

The AIRworkspace Universal Information Management Platform

The best and affordable foundation for your Digital Workspace

AIRworkspace is not another File Sync product like DropBox or Google Drive and is not a Microsoft SharePoint or EMC Documentum product that comes with a huge overhead of never used functionalities. Furthermore, you don't need months of consultant services to get the solution up and running.

AIRworkspace offers you the best of both worlds, Enterprise Content Management Functionalities with universal access via an extremely simple user interface on all devices. Our WorkAIR Windows desktop client works on Microsoft Windows 7 up and inclusive Windows 10. Open and save Office 2013 & 2016 files.

Benefits & Features

Access access, view and manage files directly on your phone, tablet, PC or Mac.

Sharing share files easily through a link.

Secure sharing capabilities add a password on your shared content.

Collaboration collaborate with your colleagues by sharing files and folders.

Search All your content is full text indexed, so you can find your information in seconds.

User Rights LDAP / Active Directory integration.

Calendar Share and Synch your appointments between mobile devices, create a Group or Project Calendar or private calendar to synch appointments with your peers.

Security secure content with encryption and automatic logout when the app is closed.

Contacts Create a central point for your contacts and Synch these between your devices.

Encryption File based encryption, server or user based.

Multilanguage Language choice for web interface.

Easy user interface.

Development Continuously improving

Integration Connect your Home Shares and Group Shares, FTP, WebDAV and many more to your account and access from one point.

Transparent Seamless integration into your organization, no data movement needed.
